Lendflow Assessment: NYT Best Sellers List & Filter

Please create a Laravel JSON API actings as a wrapper/middleman around the [New York Times Best Sellers History API](#).

All code should be well tested.

Tests should pass without valid NYT API credentials or an active internet connection.

Tests should consider edge and failure cases.

Laravel's [Form Requests](#), [HTTP Tests](#), and [HTTP Client](#) should be used. *Leveraging additional features is encouraged.*

Lendflow cares deeply about API integrations, both internal and external. Respecting the brief time constraints, consider API versioning, breaking change strategies, caching, code reusability, cross-environment testing, and more.

1. Create New York Times API Credentials

Create your own API credentials to access the NYT API:

1. Create a New York Times developer account: https://developer.nytimes.com/accounts/create
2. Go to create a New App: https://developer.nytimes.com/my-apps/new-app
3. Enable the Books API.
4. Create your app.
5. Copy your API key locally.

2. Create the Laravel JSON API

Create an endpoint around the [NYT Best Sellers endpoint](#). The endpoint should support the following subset of the NYT API's Query Parameters:

author : string

isbn[] : string

title : string

offset : integer

3. Delivery

Please publish your code to a Git service and send us a link.
